arthritis-uk.org

 **Arthritis** UK

We are Arthritis UK

We're the 10 million adults, young people and children living with arthritis. We're the carers, researchers and healthcare professionals. The families and the friends. All united by one powerful vision: a future free from arthritis. So that one day, no one will have to live with the physical, emotional and practical challenges that arthritis brings.

There are many different types of arthritis. And we understand that every day is different. What's more, what works for one person may not help another. That's why our trusted information blends the latest research and expert advice with a range of lived experiences. In this way, we aim to give you everything you need to know about your condition, the treatments available and the many options you can try, so that you can make better-informed choices to suit your needs.

We're always happy to hear from you whether it's with feedback on our information, to share your story, or just to find out more about the work of Arthritis UK. **Contact us at healthinfo@arthritis-uk.org**

Nafisa's Story

I was at my best when I turned 50. I'd decided I was going to celebrate my own golden jubilee by doing all the things I wanted to do. I'd spent years taking care of people. My son and daughter were grown up and doing really well.

Then everything changed. First, I was diagnosed with breast cancer. I asked, 'am I going to die?'. When

the consultant said no, I thought 'let's get on with it'. I'd just got over my cancer and I thought finally everything was going to be OK. Then, I was sitting on the sofa one day and suddenly I just couldn't move.

I was in so much pain. I never knew rheumatoid arthritis felt like that. I've never been in that amount of pain. In the end, I spent a year and a half in a wheelchair. I never wanted my son to have to push me around. It was horrible.

I couldn't manage. I loved my job but eventually I had to be medically retired. I was always told to try to keep moving but it's difficult when you're in so much pain.

Sometimes it's hard to remember it's not movement that's attacking your joints, it's rheumatoid arthritis and your immune system.

Then, about six months ago something changed. I got a new medication that worked. It was the fifth one I'd tried. I had two doses and it kicked in – I started feeling just that little bit better. It was just small, but I realised I could move my hand.

That was the chance I needed. I started small – slow, gentle movements, just moving my hands and my wrists, then my arms. I'd sit in front of the TV and move my feet and ankles, just gently. They were the type of tiny movements other people don't think much of, but the more I did it the easier it became, and the better I felt.

At first, I'd do 10 minutes of movement in a chair every day – most standing exercises can be done in a chair. I'd say to myself 'Get up Nafisa. Before this who were you? You can do this – get up'.

I'd try to walk every day using my frame. It took a good four months until I felt strong enough to stop using it – now I make sure I walk for 45 minutes every day. It hasn't happened overnight, but now I don't use my frame at all.

I can now touch my knee to my nose. I have such a sense of achievement just by doing that. My next goal is to get my head down to the floor – I'm going to do it.

After two years living with this illness, I feel ready to tell people how I feel. I know we're all different, but sometimes when you hear someone else's story you realise you have something in common and it gives you the confidence you need to just make a small change.

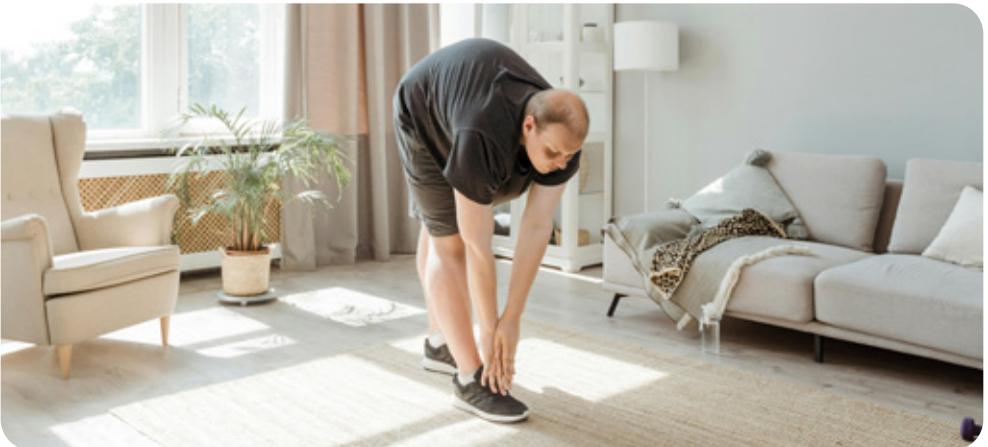

When you're in pain getting up off a chair is massive, I understand that. I can now get off the sofa, and move my body, and walk around.

Why is exercise important for people with arthritis?

It can be hard to keep moving when you have arthritis but staying as active as possible can reduce your pain and the symptoms of your condition, and help you to stay independent.

As well as reducing your pain, exercise can:

- Improve your muscle strength which keeps your joints strong and well-supported.
- Reduce stiffness in your joints.
- Help your balance.
- Improve energy levels and feelings of tiredness.
- Help you manage your weight.
- Boost your mood.

The good things that being more active can do for you:

1

Improve energy levels and mood

2

Improve muscle strength

3

Improve heart and lung health

4

Reduce pain and stiffness

5

Manage weight

6

Stay independent

Rest or exercise?

Many people with arthritis are worried that exercise could cause further damage to their joints, but exercise is good for us and helps our joints stay healthy.

Your body is designed to move and resting too much could actually cause harm to your joints and the tissues around them. You might notice after being unwell for a short time that you feel much weaker or less fit than usual. It might feel like things you used to do easily before are harder.

So it's important to stay active:

- **To reduce the risk of your muscles or other tissues around your joints becoming weaker, as this could cause more problems with your joints in the future.**
- **Many people notice the benefits very quickly once they start moving again, and feel like they have more energy or feel more confident.**

Improving your health

For some types of arthritis, people may be at a higher risk of developing other conditions that affect the heart and lungs, so it's important to do some general fitness exercises, also known as aerobic exercises, which help to improve your heart and lung health.

You can find out more about fitness exercises later in this booklet.

Exercise can also help you maintain a healthy weight, especially when combined with a balanced diet. Keeping to a healthy weight puts less strain on your joints, which can also reduce pain.

Some types of arthritis or the drugs to treat them can cause problems with your bones, leading to conditions like osteoporosis. But doing activity that puts weight through our bones helps to keep them strong, and balance exercises reduce the risk of falling, which in turn reduces the risk of breaking bones easily.

Boosting your mood

Another important benefit of physical activity is the way it can improve how you feel.

Many people with arthritis and related conditions can experience low mood or problems with their sleep, but physical activity can actually improve your energy levels and reduce fatigue, help you sleep better and boost your confidence and mood.

Being active is also a great way to socialise – either by doing activities with friends and family, or meeting people through exercise groups. This can also help boost your mood, and over time you'll have more energy to do more of the things you love.

How much exercise should I do?

It's recommended that all adults in the UK are active every day, even if they don't have a health condition.

Research shows that exercise is one of the best things you can do to improve the symptoms of arthritis and related conditions.

This doesn't mean you have to do it all in one go, and lots of people break this down into five 30-minute sessions a week or do more even shorter sessions. Even doing a little will help, so just do as much as you feel you can. If you're doing more vigorous activity, such as running, playing a sport such as tennis, or climbing stairs, you only need to do 75 minutes each week. Vigorous intensity activity is something that you can't really speak while doing and makes you very short of breath.

Each week, adults should aim to do at least 150 minutes of physical activity that makes them slightly short of breath – for example, you should be able to talk but not sing a song.

This is known as moderate intensity activity and includes things such as:

1

Brisk walking

2

Cycling

3

Swimming

There are lots of things that fit into this category, and it's important to find the right activity for you.

Moving more

It's also important to break up any periods of time we spend being sedentary – such as by sitting or not moving much – with some light activity.

Modern life has meant that many people are more sedentary now than they used to be, and many people spend more than seven hours sitting or lying down each day, which can be bad for our health.

Think about times when you are sedentary for long periods and see if there are things you could do to reduce this – for example, walking short journeys instead of driving, standing to take a phone call, using a desk that allows you to sit or stand or setting reminders to stand and stretch during the day.

Some examples of sedentary behaviour include:

1

Sitting down at a computer screen

2

Watching television

3

Using a car for short journeys

Building strength

Adults should also do activities that help build or maintain muscle strength on two days a week. If you're not able to do this, just do as much as you can.

It's a good idea to focus on the major muscles in the body – the legs, hips, back, tummy, chest, shoulders and arms.

But you don't need weights or a gym membership to work on your strength – yoga, doing the gardening, carrying shopping bags and doing some types of housework all help improve your strength.

Improve balance

It's also important to do exercises that help improve your balance on two days a week – and this is particularly important for people over 65.

Good examples include:

- **Dancing**
- **Tai chi**
- **Balance exercises**

It's important to work on balance as this reduces the risk of falls.

For information on physical activity guidelines for groups, including children and pregnant women find more information at:

gov.uk/government/collections/physical-activity-guidelines

How will I know if I have overdone it?

Sometimes when we start a new activity or exercise, we can push ourselves too much. It's important to start off gently and build up our activity levels over time.

It's normal to feel mild discomfort whilst exercising and some soreness in your muscles after exercise, especially if you're just getting started. But if you find you have significantly more or severe pain while you're exercising or after you've exercised, you should stop and talk to a healthcare professional about it.

Tips

If you do feel like you have overdone it after exercising, or if you have any joints that are hot and swollen, you could try using an ice pack or a bag of frozen peas wrapped in a damp tea towel, or something similar, to help. Put this on the affected joint for around 15-20 minutes at a time.

If you have pain – without any warmth or swelling – after you have exercised, you could use a heat pack or ice pack on the affected joint. Some people find using a mixture of both alternately can help. Even when using a heat pack, it's still a good idea to cover the skin with a towel, and don't use the pack for more than 20 minutes at a time.

If you feel better the next day, start again but slowly and gently increase the amount you do.

But if you find your pain is lasting longer than a short time after exercise, or if you have any sudden onset of pain during exercise, then you may have an injury.

If the symptoms of pain, heat and swelling continue for more than a few days you should contact your GP or healthcare team.

Many exercise-related injuries can be treated at home but if things don't improve over time, you may need to visit a GP, minor injuries unit or NHS walk-in centre, where they will be able to give you treatment and advice.

Remember that exercise injuries are easily avoided by warming up and cooling down properly, using safe equipment, wearing the right clothing and footwear, and using the right techniques.

Getting started with exercise

Do I need to see a doctor or physiotherapist?

You don't always need to see a healthcare professional to get started with exercise, as long as you take things slowly and listen to your body. If you have any concerns or worries, a healthcare professional, personal trainer or fitness instructor may be able to help.

If you're worried about starting a new activity plan, you might want to speak to a healthcare professional, such as a doctor or physiotherapist, first. They may even be able to give you some advice or specific exercises to try.

For some conditions, you might be referred to a physiotherapist. They can help you put together a specific exercise plan to help you manage and reduce your symptoms. They'll also be able to help you improve your general fitness through regular exercise.

You can also find out more about specific exercise advice for your condition on the Arthritis UK website: [arthritis-uk.org/information-and-support](https://www.arthritis-uk.org/information-and-support)

What do I need to get started?

You don't always need special equipment to exercise, and a lot of things can be done around your home, using:

- **YouTube videos**
- **DVDs**
- **Furniture**
- **Apps**

It's important to be comfortable when you're active, and this includes having the right clothing and footwear. This doesn't mean you need to spend money on specialist fitness wear, but wearing loose fitting clothes while you exercise will help you move. Try not to choose anything too baggy, as you don't want to wear anything that might get in the way.

It's a good idea to have some well-fitting, comfortable footwear too. This may be trainers which offer support and help absorb any shocks and protect your joints, especially if you're doing quite strenuous exercise. Keeping hydrated helps our bodies keep cool, so it's important to make sure you drink plenty of water before, during and after exercise to reduce the risk of dehydration.

Warming up and cooling down

It's important to warm up before you exercise, as this helps your body prepare for exercise and reduces the risk of injury.

A warm-up should increase your heart rate and body temperature, which helps your muscles get ready for exercise.

A warm-up should include some of the movements or activity you're about to do. For example, you could walk, cycle, jog or swim gently and gradually increase the effort you put in until you're a bit out of breath.

After you've exercised you can repeat some of the movements you did in your warm-up to help cool your body down. This will help reduce stiff joints or muscles after exercise.

How do I stay motivated?

It can be difficult to stay motivated once you start being active but there are a few things you can do to keep you moving:

1

Do an activity you enjoy

2

Set realistic goals

3

Do it regularly so it becomes a habit

4

Try being active with a family member or friend

5

Remember to reward yourself when you reach your goals

It's important to start off slowly and gradually build up, as if you start too fast you might find the activity painful and be put off.

To build up your activity, try to gradually increase the following:

- **Frequency** How often you do it.
- **Duration** The length of time you spend exercising.
- **Intensity** How hard you try.

Setting your activity goals

Some people find it helpful to set themselves goals when you start physical activity. This can be a good way to measure how much you've achieved since you started.

When setting goals, it's important to remember not to be too hard on yourself – your condition can be changeable, but don't let this make you feel defeated or disappointed. Even doing a small amount of movement on bad days can make such a difference and is still something to be proud of.

You should also remember that it's normal for your goals to change as your condition changes.

Try to make a record of how you feel after doing some activity and learn how certain movements make your body feel. You can also tell your friends and family about your goals, so they can help you stay on track.

Some people use the word SMART to help them set their goals. This stands for:

S

Specific

What do you want to achieve?
Why is it important to you?
When, where and who with?

R

Relevant

Is this a good time for you to set this goal? Think about your current health, other people you want to support you in this goal.

M

Measurable

How will you know when you have reached your goal?
Some people use fitness watches, apps or written trackers to keep a record.

T

Time-bound

When do you want to reach your goal by?

A

Attainable

Is your goal realistic, based on time, money and your condition?

For example

My goal is to feel less pain when walking. I plan to go on two short walks with my friend Cathy each week, gradually increasing the time we spend walking, so that in one month's time I can walk for 15 minutes without stopping.

What do you already do?

You might be surprised by how much physical activity you already do. Even being on your feet while making a cup of tea counts as being active. Household tasks that count towards your activity total include:

1

Going shopping

2

Mowing the lawn

3

Making the bed

Have a think about things you do already and see if you can find ways you could build more activity into your daily life, and make a note of what you could do. For example:

- Could you march on the spot while you wait for the kettle to boil?
- Get off the bus one stop to early?
- Do some stretches during adverts while watching TV?

What would you like to achieve?

When setting your goals, it's important to think about what moving more will mean to you. It may help reduce your pain or give you more energy – but you should also think about how it will affect you in your daily life.

If your pain is reduced, you may be able to meet up with friends. And having more energy could mean you're able to play with your children or grandchildren.

Make a note of what you want physical activity to help you with – this could be something like having the energy and confidence to go to an event, being able to reach to put on your socks, having less pain so you can walk to the shops, or simply feeling stronger and healthier.

What stops you from being active

Sometimes it can be time, energy, money, or many other things that stop us from being active. Think about what gets in the way of you being more active and see if there is anything that you could do to make this easier.

- If pain and stiffness in the morning stops you, try exercising in the afternoon
- If you're worried about spending money at an expensive gym, why not try some of our home-based exercises, or take a look at the programmes and apps at the back of this booklet

Keeping track

Keeping a record of your exercise and activity can be helpful for getting started and might help you stay motivated to keep moving on difficult days.

You can use the tracker overleaf to keep a record of your goals and what activity you've done.

Don't forget to reward yourself and record what you have done – no matter how small you think it seems. This reward can be anything – think about things like:

- Giving yourself some 'me time'
- Smiling at yourself in the mirror
- Treating yourself to something new for your home

What type of exercise should I do?

Stretching exercises

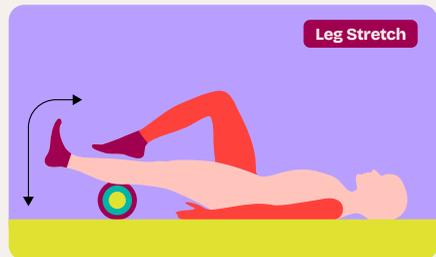

Stretching exercises are sometimes known as range-of-movement or flexibility exercises. These involve bending and straightening your joints as much as is comfortable to keep them flexible and reduce the risk of any loss of mobility.

It's easy to avoid bending and straightening your joints through their full range of movement during the day, particularly when you have pain. But not moving our joints fully can cause them to become more stiff and painful over time. They can be done as a warm-up before starting other exercises too.

A physiotherapist might be able to give you some specific stretching exercises. Other examples include yoga and tai chi. There are also some stretching exercises included on the poster that comes with this booklet.

It's important to do a mixture of exercises, including:

- **Stretching exercises**
- **Strengthening exercises**
- **Fitness exercises**
- **Balance exercises**

When doing stretching exercises, you should try to move your joints as far as you comfortably can, until you feel a stretch in the muscles around the joint. Try to keep the movement slow and controlled.

Strengthening exercises

Strengthening exercises help to keep the muscles around your joint strong and secure. Having strong muscles helps keep joints stable and can reduce pain in the joints and the tissues around them.

Changes to our muscles can happen very quickly – you might notice that you feel weaker or wobbly even after a few days of rest if you've been unwell with a cold or flu.

To strengthen your muscles, you simply need to move against some form of resistance. Even things like standing up from a chair will mean you're strengthening your leg muscles because you're working against gravity.

Other examples include Pilates and tai chi. There are also some strengthening exercises included on the poster that comes with this booklet.

Start strengthening exercises slowly and build up how much you do gently. Start with a low number of repetitions of different strengthening exercises and add to this over time. Your muscles should feel tired and like they have done some work after the exercises.

You should aim to do some strengthening exercises on at least two days a week.

If your joints are hot or swollen because of your condition, it's sometimes a good idea to focus on stretching exercises and avoid strengthening exercises until they settle down.

Fitness exercises

Fitness exercises are important for everyone to stay healthy. They're sometimes known as aerobic exercises. This kind of exercise includes things such as:

1

Cycling

2

Swimming

3

Exercise classes

Doing fitness or aerobic exercises can help to improve the strength, balance and range of movement of your joints, the health of your heart and lungs, and improve your independence.

Any exercise that gets you breathing more quickly, or your heart beating faster helps to improve:

- **The way your heart and lungs work**
- **Energy levels**
- **Your mood**
- **Sleep quality**

Balance exercises

It's important to do exercises to improve your balance on two days a week, particularly as we get older. This will help reduce the risk of falls, which in turn reduces the risks of frailty and falls, which can have more complications as we age.

There are specific balance exercises that can help, but things like:

- **Playing bowls**
- **Doing tai chi**
- **Dancing**

Either at classes or around your home – improve balance too. If practising your balance at home, make sure the area around you is clear of anything that could trip you up.

Different types of activity

There are many different types of activity you can try that will help to improve or maintain your general health and fitness. Try not to let the fact that there may not be other people with arthritis doing these exercises, as many of these activities can be easily adapted to suit you.

If you're working with a personal trainer or fitness instructor, it's a good idea to tell them about your condition and any concerns you have before you start. They should be able to suggest changes to help you exercise safely and get the most benefit from an activity. You can find more information on resources and groups for these activities on pages 36-39 of this booklet.

Swimming and water-based exercises

Swimming works the whole body but puts less weight through your joints – so it’s a great way to work your muscles without putting strain on your joints if they’re painful.

Most pools cater for people with different needs and abilities, so if you’re new to swimming or are concerned about getting in and out of the pool, speak to someone at your local pool as they may be able to help.

Being active in water isn’t just limited to swimming. It’s possible to do some exercises for your condition, with the support of the water helping reduce pain in your joints, and even walking in the pool will work your body. There are also water-based aerobics classes, which involve doing exercises as part of a fitness class, in water around waist height.

Walking

Walking briskly, even if only for a short distance or time, can help improve your lung and heart health, as well as benefiting your bones, joints and muscles. You can also try adding in periods of speed walking or walking uphill to challenge yourself more.

Remember that any walking you do usually counts as physical activity, but you can try going on routes around your local area, such as walking around the park.

Running or jogging

Running or jogging can sometimes be challenging on your joints, but it also has great benefits for your fitness and can reduce depression and anxiety. Try doing some strengthening exercises for your legs before you start.

Cycling

Cycling is a good exercise to work your lower body and is low impact so shouldn’t cause more pain to your joints. It also gets you breathing quicker and your heart beating faster, so is good for your heart and lungs.

To increase the intensity of your cycling, or to meet other people in a group class, you could try spinning. This is a low-impact fitness class done on exercise bikes. Your local gym may offer classes. You can also use an exercise bike in a gym, or get one for your home.

Fitness classes

Some people find that doing physical activity in a group can help them to stay motivated. It can help you to meet other people with a similar level of fitness to you and making friends in your class can help make exercise more enjoyable.

Fitness classes include aerobics and dance classes, but these don't always have to be high impact. Step aerobics and dance classes like Zumba can be suitable for different levels of fitness.

Yoga

Yoga includes posture and breathing exercises that can help with your general fitness and range of movement, as well as improving your mood. It's also been shown to help with back pain.

It involves slow, gentle movements which can be easier for people with joint pain, and will help improve your muscle strength and balance. It's a good idea to find an instructor who can help you adjust some movements for your condition, especially if you have had any joint replacements in the past.

Tai chi

Tai chi involves slow, controlled movements and helps with your range of movement. It's a great way for people with arthritis or joint pain to improve their muscle strength and balance too, without putting too much strain on the joints.

Pilates

Pilates focuses on balancing the body and improving your posture and can improve how you feel. The balance activities in pilates, and tai chi above, are particularly helpful as we get older as they can reduce the risk of falls.

Chair based exercises

If you're just starting out with exercise, and you struggle with walking or have pain in your legs, it can be a good idea to start out with some gentle seated exercises.

When you're doing the exercises, make sure to:

- choose a chair of the right height, so you can sit with your knees bent at a right angle and your feet flat on the floors
- avoid a chair with arms, as this could restrict your movement during the exercises
- choose a stable chair that doesn't have wheels.

Gym

Gyms have lots of different equipment you can use – including exercise bikes and treadmills. So, if you're worried about going outside to do these activities, you can practise cycling, walking or jogging indoors.

You'll usually have an induction with a fitness instructor or personal trainer when you join a gym. If you have any concerns, you can ask them for advice on training with your condition.

Tips

Doing physical activity in a group can help you stay motivated and make exercise more enjoyable.

Research and new developments

The relationship between sport, exercise and osteoarthritis

Maintaining an active and healthy lifestyle can reduce the future risk of osteoarthritis developing and progressing, particularly in the lower limb joints. Certain types of exercise have also been shown to reduce the risk of injury and help people recover from injury.

Some sports can present a small risk of injury, which can increase the future risk of osteoarthritis. That's why our Centre for Sport, Exercise and Osteoarthritis Arthritis UK is looking to better understand how exercise can reduce the risk of osteoarthritis. This work is crucial to support public health advice and clinical practice to reduce the impact of arthritis.

Research includes exploring if there's a connection between running and risk of osteoarthritis. The team are evaluating individuals who participate regularly in recreational running over time, to study the development of knee osteoarthritis.

Exercise programmes

Walk With Ease is a community-based walking programme, developed in the United States, specifically designed for people with arthritis. The programme has been shown to be effective in reducing symptoms of arthritis and improving mobility.

Our research is exploring how Walk With Ease could be implemented in the UK, and is looking at planning a trial to evaluate the benefits of the programme on physical activity and health of people with arthritis. Researchers at the University of Oxford are also developing a programme tailored for people over 80, with hip or knee osteoarthritis.

The programme will reflect the challenges people in this age group face with exercise and will aim to deliver a programme suitable for every person's ability.

Sleep, exercise and pain

Getting good sleep and doing regular activity are valuable goals and we know they can also have a positive impact on pain.

Research we fund at the University of Aberdeen is exploring the link between sleep, exercise and pain in those living with long-term pain. The research holds the potential to develop better resources and support, to improve sleep and levels of activity, and hopefully reduce pain.

E-rehabilitation

Evidence shows exercise can reduce pain and improve function of the knee. But exercise programmes needed to help relieve knee pain are usually delivered by physiotherapy services, which are overstretched. This means patients often encounter long waits and short sessions.

Making the most of technology may help resolve this issue. E-rehabilitation programmes may be a useful and effective way to deliver exercise programmes to patients in their own homes.

Research at the University of Leeds is exploring if exercise programmes delivered via the internet are a useful way to support people with knee pain. This would mean that people with arthritis have easier access to support and feel more encouraged in their recovery, ultimately reducing long-term knee pain.

Research shows that exercise is one of the best things you can do to improve the symptoms of arthritis and related conditions.

Information, apps and exercise programmes

The following section aims to give you an idea of some useful tools that might help you be more active. But there are lots of programmes, apps and sources of support out there.

You can get in touch with your local council for more information on activities in local parks and leisure centres, or visit the council's website. Your healthcare professional might also be able to suggest programmes or services that could help you.

Visit [arthritis-uk.org](https://www.arthritis-uk.org) to find out about physical activity programmes run by Arthritis UK, as well as more information on different types of exercise you can do for your condition, videos and animations.

Let's Move

You can also sign up to our 'Let's Move' programme to receive content to inspire you get active and hear stories from people whose lives have been transformed by movement.

In your area

The 'In Your Area' section on the Arthritis UK website has information on local services, including physical activity programmes, that you can join. Find out more at: [arthritis-uk.org](https://www.arthritis-uk.org)

10 Today

10 Today provides short routines to get you moving more, and is available online and on the radio. Find out more about the programme, watch the routines or find your local radio station at: 10today.co.uk

Active 10

This NHS app records your walking activity, helps you set goals and gives you tips to boost your activity. Find out more at: nhs.uk/better-health/get-active

British Wheel of Yoga

The British Wheel of Yoga website has information to help you find yoga classes near you, as well as related events. Find out more at: bwy.org.uk

Chair-based exercises

The NHS has some chair-based exercises on its website. Find out more here: nhs.uk/live-well/exercise/sitting-exercises

Couch to 5K

This is a running programme for beginners, developed by the NHS. The app helps coach you through your running activity, works with your music player and tracks your runs. Find out more at: nhs.uk/better-health/get-active

Cycling UK

Cycling UK has information on routes, local groups, and a journey planner, as well as information for beginners. Find out more at: cyclinguk.org

Disability Sport

There are national bodies promoting sport and activity for people with disabilities. Their websites have lots of useful information, including search functions to find inclusive gyms. Find out more below:

Activity Alliance (England): activityalliance.org.uk

Disability Sport NI: dsni.co.uk

Disability Sport Wales: disabilitysportwales.com

Scottish Disability Sport: scottishdisabilitysport.com

ESCAPE-pain

ESCAPE-pain is a programme designed to help people with knee, hip or back pain. It involves meeting with other people in a class, learning more about joint pain and doing tailored exercises. To find out more, visit: nhs.uk/better-health/get-active

Get Active

Get Active has lots of hints, tips and guides for getting started with different types of activity, including information on exercising with arthritis. You can also search for activities near you. Find out more at: getactive.io

The Great Outdoor Gym Company

The Great Outdoor Gym Company offers free fitness spaces in local parks. Find out more on their website: tgogc.com

Good Boost

Good Boost uses technology to create water or land based exercise programmes for people with arthritis or related conditions. Visit goodboost.ai to find out more, search for nearby classes or download the app.

Just Swim

Just Swim has information for people at all stages of swimming, including people who want to learn. Their website also has the Poolfinder to find more information on local pools, swimming clubs and accessibility. Find out more at: swimming.org/justswim

NHS Fitness Studio

The NHS has created some exercise videos which you can access for free on their website. They cover a range of different exercises, and there are some that have been created with people with arthritis or joint pain in mind, including Pilates. Find out more at: nhs.uk/live-well/exercise

Paths for All

Paths for All aims to increase the number of people walking for health every day in Scotland. You can find out more at: walkingscotland.org.uk

Ramblers

Ramblers has information on local walking groups and routes in your local area. Find out more at: ramblers.org.uk

We Are Undefeatable

We Are Undefeatable is a campaign supporting people with a range of long-term conditions, including arthritis. The website has a range of inspiring stories, suggested exercises and tips to get started. Find out more at: weareundefeatable.co.uk

Notes

Discover our support services

You don't need to face arthritis alone. Get the information, advice and support that you need.

Call our free helpline:
0800 5200 520

Connect with our online community, go to:
community.arthritis-uk.org

Chat with AVA, our online assistant, go to:
arthritis-uk.org/ask-AVA-our-virtual-assistant

Track your symptoms with our easy app, go to:

Thank you!

A team of people helped us create this booklet. We would like to thank:

**Dr Harriet Collins
Greg Bicker
Ben Jeeves
David Pilbury
Dr Janet Suckley
Justin Webb**

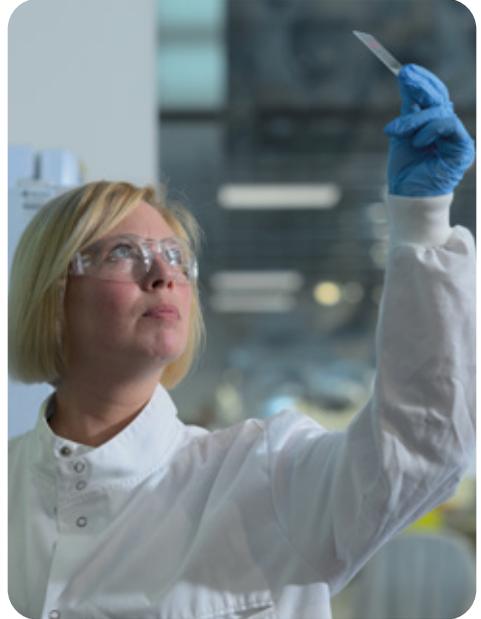

We would also like to give a special thank you to the people who shared their opinions and thoughts on the booklet. Your contributions make sure the information we provide is relevant and suitable for everyone.

Support our work

At Arthritis UK we rely on donations to fund our work. Help support people with arthritis and fund life-changing research by making a donation today. Every contribution makes a difference.
